

What is GSM 'Caller ID' Access Control?

By inserting a SIM card into one of these units, it has a unique phone number which can be called from any phone whether land line or mobile anywhere.

When a call is made, the system reads the 'Caller ID' from the calling number and then compares the number to its internal list of authorised callers. If a match is found, the relay(s) on board the unit are enabled.

The relay(s) can control gates, barriers, doors, lights, machinery, heating and more.

As well as Access Control, GSM Intercoms are also available which allow two way voice confirmation of visitors before access is granted to a visitor.

Why use them?

- Easy to install & configure
- Easy administration via text or call
- Quickly add/delete Caller ID' s
- No call costs to operate
- Up to 4000 users stored
- Remote control from anywhere

Who is using them?

- Domestic houses - electric gates
- Marwell Zoo - staff car park
- Caravan sites - visitor control
- Marinas - visitor control
- Golf Clubs - car park control
- Farmers - remote access
